- Additional press series (e.g. VPZ) and sizes on request
- Hydraulic ejectors in the table and/or in the ram on customer’s demand
- Ejector force, -stroke, -speed according to customer’s specifications
Since its foundation in 1863, LASCO has been engaged in harnessing fluid power for forming applications. At an early stage we became aware of the advantages of oil-hydraulic systems and applied them to the construction of efficient forming machines. With more than 100 years of experience, LASCO offers forming systems worldwide that are designed to withstand the demanding working environments which exist in the forming industry and are capable of performing their tasks with efficiency and reliability.

LASCO presses, with oil-hydraulic drive, combine "state of the art" hydraulic, mechanical, and electronic control technology in a functional entity, ensuring optimum productivity in a cost effective manner, for the long term.

The requirements of our customers are the benchmark for our actions, resulting in the production of machines designed specifically for each application.

Whilst the basic concepts of LASCO hydraulic presses are outlined in this brochure, we would be delighted to discuss with you, the exact performance you would expect from "your" hydraulic press.

Illustrated is a LASCO KFP cold extrusion press of 1000 tonnes capacity for extrusion of automotive parts. More than 1000 LASCO hydraulic presses, engaged in a wide range of applications, are installed worldwide.

The 300 experts at LASCO have one common goal: the delivery of machines that will ensure the client’s long term success.
Hydraulic presses are the first choice for a diverse range of solid metal forming tasks, due to the wide range of energy at their disposal, which in combination with other inherent characteristics provides high versatility.

Efficiency is maximised by the careful design of the drive unit and by the selection of modern control technologies.

Characteristics which LASCO incorporate in all their presses are rigidity, ergonomic design, operator safety, ease of operation and maintenance, and never sacrificing long term viability for reasons of cost.

Consideration of high rigidity of the press frame, optimum forming speeds, rapid pressure attainment, quick reversal of stroke, and exceptionally short contact times is afforded high priority at the design stage.

The VP, KFP and KP ranges are available with a large number of options of automation, quick tool change systems and process technology for a wide range of hot, warm, and cold forming applications, which may include combinations of descaling, upsetting, edge breaking, pre-forming, stretching, bending, extrusion, trimming, piercing, and calibrating.

Demands of the actual process will influence selection of stroke length, ram speed, function and tool area dimensions, as well as frame construction, press drives, ram depth and guidance, and possibility of ejection systems.

Customer preferences will influence the design of the control system and tooling application.

LASCO is able to offer not just the construction, fabrication and assembly of a press, but an integrated production and quality system, incorporating all the features requested by the customer, with development done in house, ensuring a smooth installation and start up in the customer's plant.
Ensuring profitable production

A billet is pre-formed for a ring, on a VPE 800.
LASCO concepts

Comprehensively proven...

Press frame design
The choice of press frame design, either single piece or multiple element construction is determined by table area, installation height, ram stroke and application.

- Single piece weld fabrication, stress-relieving heat treated.
- Multiple element press frames, consisting of press table, uprights and cross head, pre-stressed with four tie rods.

Multiple element press frame
The press frame offers certain advantages, compared with single piece frames. Different materials of special suitability may be considered for the individual parts.

Potential notch stress concentrations at the connection between the table and the uprights and between the cross-head and the uprights on single piece frames are eliminated.

Transport of multi piece presses may be easier and at lower cost, as press is able to be disassembled into smaller units.

Above all, the press frame consisting of several parts is considerably more rigid as a result of the pre-stressing. For the same tensile stress, the elongation is only 20% of the value induced in a single piece frame.

As well as ensuring longevity of the frame, and forming of more accurate parts, overall size and weight of press may be reduced.

Bolster plate on the table
LASCO presses are equipped with a protective bolster plate on the table to minimise wear. They are supplied as standard with T-slots for holding the tools, with option of custom designed hydraulic clamping systems.

Press cylinder
The press cylinder is forged steel with the bore honed. A pre-fill valve between the top of the cylinder and the oil tank ensures rapid filling and return of the oil. Split chevron packings with wiper rings provide a seal between cylinder and piston.

Press piston
The press piston is also forged. The contact surfaces are hardened, ground, and polished. A bronze bush ensures optimum sliding characteristics in the upper sealing and guiding area.

Ram
The ram may be either a steel casting or weld fabricated, fully stress-relieved. It is accurately mated with the bore in the piston and clamped securely.

Guiding system
The guiding system is designed according to the specific application. For hot forming processes, a system maintaining constant clearance in spite of heat expansion has become standard. For cold forming, a guiding system with eight slideways is preferred. The sliding surfaces are bronze running on nitrited steel. Tight clearances may be maintained and are adjustable by shims.

Combined with the long ram guiding system and the high press rigidity, production of high accuracy parts with excellent tool life is assured.
**Ram support device**
A pneumatically operated, electrically safe-guarded ram support device provides operational safety and prevents unintentional movements of the ram. The ram may be locked in its top position, when work is being carried out in the tool area. This safety feature is integrated into the press control system.

Sections of frames of LASCO presses - single piece (right top side) and pre-stressed multi piece (left).
Hydraulic drive system

The "heart" of the press

Press drive
The press drive determines the efficiency of a press by its performance and quality. LASCO designs the system in house, and manufactures the manifold block. The pumps and valves are sourced from major hydraulic companies with highest standards of technology and after sales and spare parts service.

Direct drive, accumulator drive, combination
Depending on the size and the characteristics of the press, LASCO considers three basic concepts of hydraulic drives: the direct drive, the accumulator drive, and a combination of the two. Press forces from 1000 kN to 50000 kN may be achieved with these systems.

LASCO prefers to install the drive system on the head of the press, with the advantages of good accessibility to all hydraulic elements and short pipe connections between the pumps, accumulator, and cylinder, as well as a clear floor area. However, option of floor mounting of the drive system is available in situations where the overall height is restricted.

The constant temperature of the hydraulic oil is maintained by a heating system installed in the oil tank. A separate cooling/filtering system driven by a pump prevents the maximum temperature from being exceeded and continuously cleans the oil. Status of the filters is indicated on the screen of the control system.

Lubrication
The lubrication of the slideways is by oil. Adjustment of the amount and frequency is through the electronic control which also prevents the oil level from dropping below the minimum.

In the case of a direct drive, the movements of the hydraulic press are dependent on the delivery of pressurised oil provided by the pumps. This solution is preferred, when a particular performance is required over a relatively long stroke, with a high stroking rate.

LASCO employees are installing the hydraulic drive of a VPE.
The pump-accumulator drive stores part of the energy in the accumulator. This solution is preferred when high pressing speeds are necessary, but production output is not high, allowing time for recharging the accumulator, between press strokes, and reducing the size of the motors installed.

Hydraulic drive on the head plate.
Decentralised process control
If the hydraulic system is the "heart", then the "brain" of a modern hydraulic press is the decentralised process control. As LASCO is totally customer focused, all configuration and programming is performed in house.

LASCO's competence in software programming and in the design and installation of electronic, electrical, and mechatronic components allows the consideration of all customer requests that are technically feasible, including the provision of interfaces for integration of existing processes and inter-linked operations.

LASCO press and process controls offer all the performance characteristics of a modern product organisation, such as:

- Centralised, product-related setting and evaluation of all machine parameters.
- Product data administration with connection to a database.
- Operating data registration.
- Product follow-up.
- Integration in MRP.
- Integrated maintenance programme.
- Integrated data logger.

The requests of the customer are also considered, when designing man-to-machine interfaces, as well as specific screen menus and charts (available in several languages).

The operator is guided by a graphic colour display, which is in the same language as the messages displayed at the terminal. The registration, evaluation, and listing of data can be input during operation and the data can be transferred into the company network via interfaces.

Software modules specific to the customer can be linked. Options of integrated phone- or internet-aided on-line maintenance systems are offered.

The design, installation, and programming of electronic, electrical, and mechatronic components are core competences of LASCO.
LASCO designs the operator menus and screen forms of a control system individually according to the customer’s demand, in this case, located in China.

Efficient interfaces ensure the real-time communication with automation systems and industrial robots. In principle, a data logger is integrated and offers the possibility of archiving internal and external analogous and binary signals.

LASCO control concepts are decentralised on the basis of bus systems. Only hardware of international industrial standards is selected. This permits customers the possibility of making adjustments and performing maintenance work on their own as well as reprogramming and enhancing at a reasonable price. Not least this means a high security of investment.
The VP range of LASCO presses covers a large spectrum for hot metal forming of solid parts. The press forces and characteristics are chosen for each application. This versatility makes the LASCO VPs ideal presses for pre-forming tasks, such as edge breaking, upsetting, bending or material distribution.

In addition, the sturdy VP series are well-suited for tasks demanding one step finishing, or for intricate forming processes with several stages, as well as for extrusion.

By doing the pre-forming of components which are finished subsequently in die forging hammers or presses - it increases productivity and efficiency of the forging process, while at the same time optimising material utilisation.

Salient features of the LASCO-VP range are their high capacities and their rigidity which permits the application of eccentric loads, long ram guidance, infinitely adjustable pressing speeds and press stroke, and precise pressure control.

The VP series provide customers with a versatile press, capable of a wide range of applications, at an economical cost. The precise control depending on force, speed and/or distance is the key to precision of the single forming operation and its repeatability.
Versatile press with a wide range of applications

Lubrication of the dies of a VPE 500 (top). LASCO VPA 1250

Layout of the basic design of a LASCO press from the VP range.
It is often a requirement on some pressing applications that the nominal press force is available for the entire stroke at maximum speed. Thus, the VPA range has been designed especially for massive forming with a high press force, such as is encountered in the manufacture of extruded parts, for example, automobile axle tubes. A favourable ratio between the width and the height of the ram and accurately adjustable slideways permit the precise forming of long components with a high eccentric load.

The VP series from LASCO have proven their capabilities worldwide in combined forming operations. Thus, the piercing and
drawing press VPZ performs on a single setup the type of work that would normally have to be applied to two presses, a hot extrusion press and a subsequent ironing press. Long, axially symmetrical hollow parts up to an outer diameter of approx. 350 mm and a length of approx. 2000 mm, such as axle tubes, tool joints and gas bottles, are produced on a VPZ - including ironing and indenting - with consistent precision and high output.

The hot ironing following the hot extrusion process can either be effected with a movable drawing punch, or with a drawing slide. The part manipulation and the combined inner and outer cooling of the tools is automated.
LASCO KFP hydraulic cold forming presses are capable of producing parts with a tolerance of one-hundredth of a millimetre.

Cold extrusion is among the most important processes for the economic forming of near net-shape parts in large volumes. The KFP characteristics of stroke, force, and speed are particularly suited to the rigorous demands imposed by cold extrusion.

World-wide a multitude of different parts, including drive pinions, starter shafts, hollow shafts, and similar automotive parts, are cold forged on LASCO KFP presses. In a combined process of forward, backward, and cross extrusion, intricate parts, such as spiders, can be produced in an efficient way and with consistent quality.

A LASCO KFP is capable of incorporating several subsequent
forming stages in the tool area. A guiding system with eight slideways ensures the utmost precision at each stage. Options, such as shifting slides, rotary punches and tables (top or bottom), as well as feeding and handling devices for billets or for pre-formed parts, allow the KFP to be considered for fully automatic production. Ejector systems integrated in the press table and the ram are standard features.
Hot calibration of powder-forged synchronous rings.

Calibrating of parts after the actual forming operation is often required to meet dimensional tolerances, improve surface finish and straightness.

LASCO KP calibrating presses are intended for the cold, warm, and hot calibration of parts, but may also be considered for trimming, piercing, and bending operations.

The tool area has been designed for a wide range of applications and is able to accept eccentric loads. The pressing speed and press force is infinitely adjustable, up to maximum values, and combined with accurate ram positioning by servo drive, ensures a high calibrating accuracy.

Basic presses are able to be retro-fitted with upgrades to hydraulic and electronic control circuits, to meet unforeseen future production demands.

Examples of powder-forged and standard sintered parts that are calibrated on LASCO calibrating presses.
An economic way to achieve final geometry

Basic design of a LASCO KP calibrating press (schematic).

LASCO KP 630.
Adaptable to special demands

LASCO hydraulic presses for hot, warm, and cold solid metal forming embody leading technology in all their elements and reflect "state of the art" process technology. Their inherent characteristics are rigid design and power in reserve. Highest levels of efficiency are achieved by individual adaptation of the press to the specific demands of the customer.

LASCO defines its role as a highly flexible press manufacturer in providing tailor made solutions to complicated and changing demands. Our process specialists develop efficient line concepts starting with the range of the parts to be formed, and the particular demands of the client.

Their goal is to harmonise all major parameters of the forming unit and the tooling, resulting in the most economic forming process. The result is usually a truly unique solution for each project.

The computer-aided simulation of forming processes plays a major role in the development of all LASCO machines and forming solutions (top).
Of course LASCO offers also a wide range of peripheral equipment to augment the production process of the main unit.

This option permits consideration of almost any automation for our presses, but also their successful integration into inter-linked processes.

**Optional components**

- Automatic loading and unloading devices
- Tools and tool holders (with temperature control as an option)
- Quick-changing systems for tools, tool holders or cassettes
- Tool conditioning units
- Hydraulic ejectors in the table and in the ram (multiple operations)
- Sound isolation and enclosures
- Manipulators (in the press and outside)
- Robots
- Protective devices
- Hydraulicdescalers
- Electronic on-line maintenance

Comprehensive service

The LASCO benefit

Your single source for engineered solutions

All components of a forming system that are essential for it to perform consistently are sourced from leading international suppliers or made in house by LASCO’s highly experienced and motivated experts. This fact, combined with the flexibility and the concise management of a medium-sized company, enable LASCO to react in a comprehensive manner to requests and to offer perfect solutions from one source.

Complemented by personal service all around the globe, LASCO guarantees its customers a level of performance that has set the industry standard for decades.

Experts in the sales, design, manufacturing, installation, and service departments enable LASCO to take care of its customers' requests in a flexible and comprehensive way.

LASCO employees co-operate in interdisciplinary project teams to find the optimum solution for your forming requirements.
